Vehicle Tracking System is nowadays commonly used by fleet operators for fleet management functions such as routing, dispatch, on-board information and security. When managing a fleet of vehicles, knowing the real-time location of the vehicles allows more efficient management to meet customer needs at lower cost.

Vehicle Tracking Solution developed by EC combines the use of GPS (Global Positioning System), GSM (Global System for Mobile communications), and the most widely used Google Maps, to produce a much more powerful all-in-one solution to vehicle tracking, making vehicle tracking more accurate and easier than ever, and enhancing effective and efficient fleet management.

With EC Vehicle Tracking Solution, and the use of GPS Tracking Device with built-in GSM module, vehicles can be tracked in real-time with accuracy, using inexpensive devices such as cell phones or personal computers with telephony or internet connection. Vehicle location can be viewed on the user-friendly Google Maps interface through the online application, and the work progress and activities can be accessed in real-time.
